

Laminate Glass Fitting Instructions

As you are fitting a laminate glass you have been supplied with three types of packers, these packers are varying in thickness to cope with the glass thickness. The white thin packer is 1.5mm in thickness and the black 1mm in thickness. The thicker white packer is 6mm in thickness.

The packers are to be doubled up with the 6mm packer against the channel with either the 1mm or 1.5mm against the glass. This will be dependant on the thickness of the laminate and how far the aluminium wedge can be pressed in before beating in with the hammer and bolster (see fitting instructions page two).
